Methyl Bromide Alternatives Research Project

Michael Langemeier

Sulfuryl Fluoride Fumigation Workshop August 19-21, 2009

Outline of Presentation

- Introduction
- Economic Analysis
 - Partial Budgeting
 - Previous Research
- Other Considerations
 - Competitive Advantage
 - Risk
- Expected Products

Introduction

- Need to examine methyl bromide (MB) alternatives
 - Heat treatment (HT)
 - Sulfuryl fluoride (SF)
 - Integrated pest management (IPM) approaches
- Cost-effectiveness of MB, SF, and HT has not been adequately evaluated
 - Data collected at different times of the year
 - Treatment efficacy is difficult to determine
 - Traps capture only adults
 - Immigration of adults from outside facility
 - Important to examine treatments in the same facility under similar environmental conditions and treatment practices

Introduction

USDA/CSREES Project

- A 3-year project funded in September 2008
 - www.oznet.ksu.edu/grsc_subi/MBT_project
- Collaboration between K-State GSI, K-State Ag Econ, USDA-GMPRC, and Purdue University
- Also supported by food industry service providers (Dow AgroSciences, IFC, Presto-X, Temp-Air) and stakeholders

Economic Analysis

 Analyze cost-effectiveness of MB, SF, and HT in food-processing facilities through research in pilot-scale and commercial facilities

Research Activities of Project

Project Research Activities

- Apply MB, SF, and HT in Hall Ross (pilot) mill
- Monitor gas and temperature
- Assess efficacy against red flour beetle life stages (eggs, young larvae, old larvae, pupae, and adults at two sanitation levels-dusting and 2 cm high flour))
- Determine benefits and costs of each treatment
- Refine and implement models in commercial facilities;
 train end users to use these techniques

Economic Analysis

Partial Budgeting

- Additional Costs and Reduced Revenue
- Additional Revenue and Reduced Costs

Other Considerations

- Competitive Advantage
- Risk

- Involves answering four questions:
 - What new or additional costs will be incurred?
 - What current costs will be reduced or eliminated?
 - What new or additional revenue will be received?
 - What current revenue will be lost or reduced?
- Questions should be answered on the basis of what would happen if the proposed alternative was implemented.

Additional Costs

 Costs that do not exist at the current time with the current plan.

Reduced Revenue

 Revenue currently received but which will be lost or reduced should the alternative be adopted.

Additional Revenue

Revenue to be received only if the alternative is adopted.

Reduced Costs

 Costs now being incurred that would no longer exist under the alternative being considered.

Partial Budgeting Format

Description of Problem					
Additional Costs:	Additional Revenue:				
Reduced Revenue:	Reduced Costs:				
A. Total	B. Total				

Net Profit Change (B. – A.) _____

 Example: Methyl Bromide Critical Use Renomination for Post-Harvest Treatment of Structures, 2011

Important Notes:

- Cost and revenue estimates from the renomination are used below.
- Estimates for our project may differ.

 Example: Methyl Bromide Critical Use Renomination for Post-Harvest Treatment of Structures, 2011

Assumptions:

- 1,000,000 cubic foot facility
- Temperature at 29.44 C or 85 F
- Prices of methyl bromide and sulfuryl fluoride were assumed to be the same

Partial Budgeting Example

Description of Problem: Alternative: Sulfuryl Fluoride

Additional Costs: \$26,932.75

Additional Revenue: \$0

Reduced Revenue: \$0

Reduced Costs: \$13,001.75

A. Total \$26,932.75

B. Total \$13,001.75

Net Profit Change (B. – A.) $\frac{-\$13,931.00}{}$

Current Project

Cost Considerations

- Cost budgets and capital budgeting will be used to compute the costs associated with MB and SF fumigations, and HT in the Hal Ross flour mill and commercial facilities
- Costs include the following: fumigants, monitoring devices, energy, labor, and equipment costs (leasing; purchasing).

Current Project

Revenue Considerations

– Revenue from alternatives may be reduced if a portion of the product needs to be discarded due to the treatment or the plant needs to be shut down for a relatively longer time period due to the treatment.

Other Considerations

Competitive Advantage

- Competitive advantage can be obtained by either focusing on cost or product differentiation.
- Firms that focus on cost need to make sure that the price they receive is similar to other firms with this strategy. If lower costs result in lower product prices, the firm does not have a competitive advantage.
- Firms that focus on product differentiation need to make sure that the higher price that they receive is not the result of having an uncompetitive cost structure.
- There is no such thing as a "one size fits all" strategy.

Competitive Advantage

Relative Price Per-Unit

_		Lower	Average	Higher	
	Lower	1 Indeterminate Position	2 Competitive Advantage	3 Competitive Advantage	
Relative Cost Per-Unit	Average	4 Competitive Disadvantage	5 Parity Position	6 Competitive Advantage	
	Higher	7 Competitive Disadvantage	8 Competitive Disadvantage	9 Indeterminate Position	

Competitive Advantage Resource Based Framework

- Identifying and utilizing unique resources that are difficult for other firms to obtain is a key component in sustaining a firm's competitive advantage.
- Firms without any unique resources will find it increasingly difficult to compete.
- Framework involves asking four questions.

Competitive Advantage Resource Based Framework

The Question of Value

 Does the firm's resources and capabilities enable the firm to respond to environmental threats and opportunities?

The Question of Rareness

– How many competing firms already possess particular valuable resources and capabilities?

Competitive Advantage Resource Based Framework

The Question of Imitation

– Do firms without a resource or capability face a cost disadvantage in obtaining it compared to firms that already possess it?

The Question of Organization

– Is the firm organized to exploit the full competitive potential of its resource and capabilities?

Resource Based Framework Is a Resource or Capability ...

Valuable?	Rare?	Costly to Imitate?	Exploited by Organization?	Competitive Implications	Economic Performance
No	No	No	No	Disadvantage	Below Normal
Yes	No	No	No	Parity	Normal
Yes	Yes	No	No	Temporary Advantage	Above Normal
Yes	Yes	Yes	Yes	Sustained Advantage	Above Normal

Adapted using information in Chapter 3 of Barney and Clark (2007).

Other Considerations

Impact of Risk

- Cost, revenue, and efficacy depends on many factors including labor costs, fumigant costs, and fuel prices.
- The optimal control strategy may change as these factors change.
- One of the easiest ways to examine risk is to use sensitivity analysis.
 - Example: Examine the impact of a change in fuel prices on the feasibility of a heat treatment.
- If data is available, an optimization model can be used to examine risk.

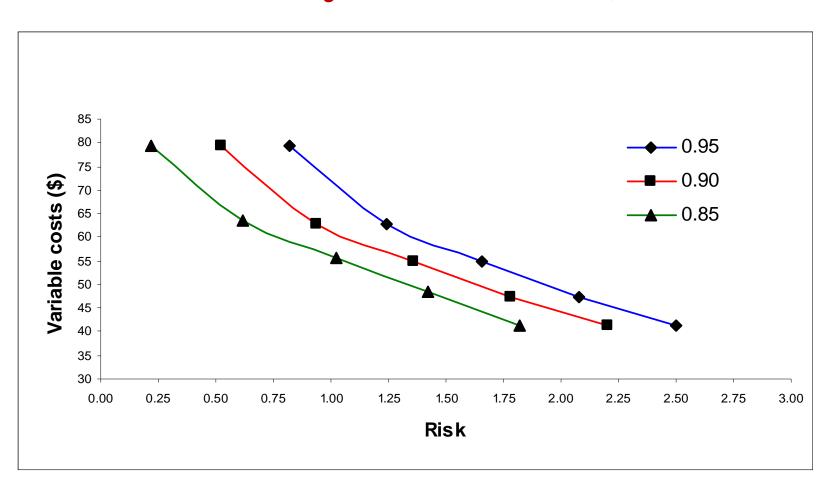

Risk Research

Past Research: Tilley et al. (2007)

- An economic model of heat treatment and chemical applications was developed using minimization of costs at a target risk level associated with grain damaging insects.
- Costs included labor, energy, and fumigants
- Risk was measured as a deviation below a target mortality goal.

Empirical Risk Model

Tilley et al. (2007)

Incorporating Risk

- Data permitting, the model developed by Tilley et al. (2007) will be used to examine the tradeoff between insect mortality and cost across control strategies.
- This model examines the tradeoff between cost and total deviations below a target insect mortality rate.
- As the model allows for more total deviations below this target, cost decreases.

Project Outcomes

Economic Analysis

- Extension and research papers comparing the cost, revenue, and efficacy of the MB and SF fumigations, HT.
